

Cybersecurity Incident Report:

Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.

The UDP protocol reveals that DNS requests were sent using UDP to port 53 on the DNS server. This is based on the results of the network analysis, which show that the ICMP response returned the error message "udp port 53 unreachable". The port noted in the error message is used for DNS requests. The most likely issue is that the DNS service or network path to UDP port 53 is unavailable or blocked. As a result, the computer cannot receive the IP address for `yummyrecipesforme.com`, which prevents the website from loading.

Part 2: Explain your analysis of the data and provide at least one cause of the incident.

Time incident occurred: 13:24:32:192571

The IT team became aware of the incident when customers reported that they could not access the website and received a "port destination unreachable" error. The IT department attempted to access the website and used `tcpdump` to investigate the network traffic. They found that the computer repeatedly sent DNS requests to the DNS server, but they received the same error message "udp port 53 unreachable" everytime. A likely cause of the incident is that the DNS service at port 53 is unavailable, or that a firewall or network configuration is blocking access to that port. The investigation found that DNS requests were being sent using UDP to port 53 on the DNS server. The server returned ICMP messages stating "udp port 53 unreachable."
